

Company Profile

Associated Fire Protection is a leader in providing advanced fire protection and life safety technology throughout the NJ/NY/CT tri-state area. We consistently meet our customers' requirements with creative, innovative and cost-effective solutions no matter how challenging the task. Ultimately, we help protect our customers from the ravages of fire, help save lives, protect their property and ensure their business continuity.

As a full line resource, we provide complete consulting, engineering, design, installation and maintenance services. Working closely with our customers, we develop custom designed alarm and fire protection systems that meet their individual needs. The customers we serve range from Fortune 500 companies with multi-site locations to companies with 50 or less employees.

Our engineering department designs sophisticated alarm systems and the latest "clean agent" fire suppression systems, including FM-200 and CO2, for the protection of expensive equipment, computers and valuable data. We design sprinkler systems for routine to the most complex applications. We also perform engineering analysis to determine the effectiveness of existing systems and the correct modifications that may be required to meet local fire safety codes.

Our installation department is staffed with expert electrical and mechanical technicians with a total of over 150 years experience. And, consistent with our "full line resource" philosophy, our installation professionals install most of the jobs our engineers design.

At Associated Fire Protection, our service department is committed to providing the most reliable, dependable scheduled service. We offer a wide range of service options to meet our customer's needs and budget. AFP service starts with our Standard Agreement and continues with Protection Plus and Platinum Plus to meet even the demanding requirements. All service scheduling is handled by our in-house computerized system, so we are always on time. When emergency service is necessary, we respond rapidly to meet the challenge. We also offer central station monitoring for those customers that need it.

Regular training and attendance at professional development meetings keep our engineering, installation and service staff's skills finely tuned and keeps them fully aware of the latest fire protection industry developments, including up-to-date building and fire safety codes.

Founded in 1947, Associated Fire Protection was built on the belief that providing the latest in fire protection technology must be combined with the highest level of service in order to truly offer value to our customers. As we have grown, we have steadfastly maintained these principles.

In fact, we practice them every day.
